Correlation to the Common Core State Standards

Saxon Math 1
© 2012 Grade 1

Revised April 2012
Problem solving is integrated into the *Saxon Math™* program every day. Focusing on a four-step problem solving process, which guides students to understand, plan, solve and check, *Saxon Math* teaches students a consistent process for evaluating different problem solving situations and persevering in solving them. The four steps closely mirror the different aspects of this Standard for Mathematical Practice, encouraging students to understand the problem and make a plan before solving. Students also end by checking their solutions, providing opportunities to ask, “Does this make sense?” and re-direct if necessary.

In *Math 1*, problem solving occurs in many different portions of the lessons. The daily Math Meeting offers discussion and communication on problem solving every day, with many of the problems focusing on numbers, patterns, and sorting/classifying. This prepares children for solving more complex problems as they move up the grade levels. The Teacher's Manuals also support teachers as they guide students through the four-step problem solving process during the instructional portion of the lesson. For example, in Teacher's Manual Volume 2, lesson 90-2 provides a modeled dialogue that highlights the understand, plan, solve and check process. This prepares students for a Performance Task where they apply their learning independently.

**INSTRUCTION:**

**New Concept:** Lessons 12, 13, 15-1, 19, 21, 25-1, 27, 33, 39, 40-1, 66, 74, 81, 82, 85-2, 90-1, 91, 108, 114, 123

**MAINTENANCE:**

**The Meeting** (Mystery Bag): Lessons 81, 84, 87, 91, 94

**The Meeting** (Counting Patterns): Lessons 31, 38, 53, 106, 125

**Lesson Worksheet:** 21, 74, 81, 90-1

**Guided Class Practice Worksheet:** 7 (2, 3, 4), 16 (entire page), 23 (entire page), 27 (entire page), 47 (entire page), 48 (entire page), 69 (entire page), 74 (entire page), 82 (entire page), 112 (entire page), 114 (entire page), 119 (entire page)

**Math Center Activities:** p 17 Activity 63 (Lesson 75-1); p 19 Activity 75 (Lesson 86); p 21 Activity 91 (Lesson 108); p 21 Activity 96 (Lesson 114)

**Test-Taking Strategies Practice Masters:** 12A/B; 13A/B; 14A/B; 16A/B; 18A/B; 20A/B; CRB (8, 13)

In *Math 1*, during the daily lesson, new concepts are introduced with manipulatives and concrete objects for a concrete-pictorial-abstract approach. This allows students build a solid conceptual understanding so that they are able to solve complex and multi-step problems. By introducing concepts with concrete manipulatives, students better understand what numbers, patterns and operations mean. This understanding allows them to think flexibly in problem solving situations and builds the foundation for the ability to contextualize and decontextualize.

For example, in the Teacher's Manual Volume 2, the New Concept portion of lesson 108 has children use linking cubes to compare quantities. By the time children reach the symbolic stage of using greater than, less than and equal symbols, they have a better understanding of what they mean since they were able to actually see and interact with the concepts using the manipulatives.

<td>Standards for Mathematical Practice</td>
<td>3.</td>
<td>Construct viable arguments and critique the reasoning of others.</td>
<td>This standard is covered throughout the program; the following are examples.</td>
<td><em>Saxon Math</em> is based on the belief that people learn by doing. Students learn mathematics not only by watching or listening to others, but by communicating and solving the problems themselves. <em>Saxon Math</em>'s incremental and distributed structure enables students to view the big picture of mathematics and therefore make viable arguments between and among all of the math strands.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td><strong>INSTRUCTION:</strong></td>
<td>In <em>Math 1</em>, the daily Math Meeting offers a forum for students to participate at their own levels and offer viable arguments on key topics. The Teacher Materials also provide modeled dialogues to help students demonstrate their understanding verbally. During the daily lessons, the New Concept instruction allows for student interaction between peers with open ended questions after a concept is taught. Additionally, Mathematical Practices discussion questions in the Section Overviews provide additional opportunities for students to explain their reasoning, critique the reasoning of others and solidify their learning.</td>
</tr>
<tr>

<td>Students use many different types of models throughout Saxon Math to analyze mathematical relationships and solve problems. Models serve as visual aids to help make sense of situations so students truly understand the problem at hand and both how and why their solutions work. For example, in the New Concept portion of lesson 9, students use linking cubes to visually order sets from smallest to largest. Children learn that modeling a situation makes it easier to make conclusions about it and solve problems.</td>

<td>Standards for Mathematical Practice</td>
<td>5.</td>
<td>Use appropriate tools strategically.</td>
<td>This standard is covered throughout the program; the following are examples.</td>
<td><strong>Saxon Math</strong> provides and supports grade level appropriate tools for instruction and problem solving. This begins with concrete models at the primary levels and moves to more sophisticated tools like geometry software at the secondary levels. Saxon offers instruction and guidance for appropriate usage throughout the program. In <em>Math 1</em>, the daily Math Meeting models concepts with objects and manipulatives. Other tools such as a Hundreds Chart, a calendar, clock, and a thermometer are modeled visually every day during the Math Meeting. Students also use manipulatives as strategic tools during the New Concepts and practice when concepts are introduced and instructed. For example, in lesson 71 students are asked what kinds of things they think they could use to measure line segments. Once the class decides upon a ruler, the teacher guides them through a discussion about why that tool is strategically the best thing to use to measure line segments.</td>

<tbody>
<tr>
<td>6.</td>
<td>Standard</td>
<td>Attend to precision.</td>
<td>This standard is covered throughout the program; the following are examples.</td>
<td>There are many aspects of Saxon Math that naturally support attention to precision in mathematics. Because Saxon Math teaches concepts incrementally, distributed across the year, students learn to carefully consider units since concepts are integrated rather than taught in isolation. Additionally, carefully modeled dialogues in the Teacher's Manual ensure that children are exposed to consistent and accurate vocabulary and definitions, allowing them to communicate precisely. For example, lesson 110-1 teaches students how to precisely identify cups, quarts, gallons and liters. Teachers clearly explain what this vocabulary means and then guide the students through activities with different containers to demonstrate their meanings.</td>

<td></td>
<td>7.</td>
<td>Look for and make use of structure.</td>
<td>This standard is covered throughout the program; the following are examples.</td>
<td>Saxon Math emphasizes structure throughout the program. A strong focus on number properties and patterns prepares students to utilize structure in problem-solving situations. Because the fundamentals of number and operations are highlighted in every lesson through mixed review, students develop a strong sense of mental math and comfort composing and decomposing numbers. In Math 1, the daily Math Meeting provides a consistent structure and routine for students to learn concepts and make connections. This helps children see patterns between numbers, operations, shapes, months, days of the week, measurement and temperature. For example, the Counting Pattern is a consistent element in the Math Meeting that shows patterns with numbers, skip counting, fact families, and beyond. Fact Practice is another integral part of the structure in Math 1. This practice enables students to build off of known facts in order to learn new, more complex ones and to see and understand the connections between them. New Concepts also teach students how to look for and make use of structure. For example, lesson 58-1 focuses on exploring the place value of two digit numbers. Students learn how to use the structure inherent in our base ten system to solve problems.</td>

<td>Standards for Mathematical Practice</td>
<td>8.</td>
<td>Look for and express regularity in repeated reasoning.</td>
<td>This standard is covered throughout the program; the following are examples.</td>
<td>Regularity and repeated reasoning are supported throughout the <em>Saxon Math</em> program to ensure students understand their importance and how they can be used to solve problems. Repeated reasoning scenarios allow students to make better sense of number and operations. Daily Meetings and lessons draw out and explain how and why repeated reasoning works. Subsequent practice helps to solidify that understanding. For example, children interact with an evolving bulletin board in the daily Meeting. Each day children build upon the bulletin board a little bit, exposing patterns and making connections between numbers and operations. The daily Meeting is an ideal setting for students to look for and express regularity in repeated reasoning. In the Calendar activity, children add a calendar tag to the calendar each day that corresponds to a specific pattern for that month. Students begin to pick up on this pattern as the month goes on, recognizing that they are using the same calendar tags consistently. This repeated reasoning then allows them to make predictions about what calendar tags they will use in the future.</td>

## 1.OA Operations and Algebraic Thinking

### Understand and apply properties of operations and the relationship between addition and subtraction.

During the Grade 1 development of addition and subtraction a strong link is developed between joining and separating through story problems with concrete objects, pictures and ending in a number sentence or equation that represents and solves the word problem. Everyday students draw and solve word problems that involve the action of adding and subtracting based on the missing addend and fact family link that supports an understanding of the Commutative and Associative properties of addition through the detailed examples, practice and problems. During the Meeting, students explore facts and fact patterns through the practice of counting and fact development problems. These activities parallel to word problem development in an effort to support recalled fact mastery and pattern recognition with addition and subtraction facts. These efforts are linked to the development of word problems as well so that students can transfer the new facts mastered and apply that learning in a word problem situation to support deeper learning and application.

### 1.OA.3

Apply properties of operations as strategies to add and subtract.²

² Students need not use formal terms for these properties.]

Saxon provides a rich, complete incremental development of the equations that represent word problems as well as solving these problems. During the development of (joining) some, some more, (separating) some, and some went away problems students learn to use equations to represent a problem, determine the operation needed to solve a problem and then solve the problem using simple equations. This method of development allows students the time to practice and master a deep understanding of the addition and subtraction equation. Once learned, students have a daily opportunity on the guided class practice and homework to practice and extend the learning through problems and problem development and creation. In lesson 23 the students are introduced to the equal sign and number sentences that are equal by showing a relationship using zero in each place of the number sentence to show the function of the addition and equal signs.

<p>| 1.NBT.1 | Understand place value. | Place value is developed incrementally to allow students a concrete understanding of the number, value and place value of tens and ones. Along with tens and ones the students explore, practice and learn all the numbers that comprise tens and multiples of ten through various combinations of numbers. Students can then compare numbers to determine their value, place value and order. Saxon provides a strong number sense basis to allow a better understanding of number and place value related to numbers. Comparison symbols are used to label numbers as greater than, less than and equal to help students see a visual image first using bars and then moving to the abstract using numeral representations with the appropriate comparison symbols. |</p>

<td>1.MD Measurement and Data</td>
<td>1.MD.4</td>
<td>In order to better understand and interpret data, students learn all the elements of collecting data as well as building a real graph, a picture graph and a bar graph related to various information collected. Again, as with every Saxon concept, data is developed across the year in small increments to help students understand, practice and master collecting, analyzing and comparing data in a variety of formats and appearances. Students explore and determine similarities and differences of data listed on graphs. Students represent the data collected daily on the weather graph and determine the changes and trends of data. This daily collection allows students to determine changes through more and less designations based on the weather changes and trends. Various questions are asked to determine and support thinking around the data collected and determine the knowledge and understanding of the data collected.</td>

<tr>
<td>Geometry</td>
<td>1.G</td>
<td>Reason with shapes and their attributes.</td>
<td>Geometry is developed across the elementary grades in an incremental fashion distributed across each year to develop a strong understanding of geometric concepts. One of the primary concepts vital to the success of geometry is the development of two and three dimensional shapes and their attributes. Students learn shapes and their attributes incrementally to allow time for the students to learn and master each shape before the next shape(s) are added. This process provides a solid foundation and understanding of each of the different shapes so that students can begin to compare their attributes and determine the similarities and differences. As with every new concept developed in Saxon Math, the concept of geometry begins concretely and moves to an illustration and then student representations for each shape. Once these are mastered, then shapes can be manipulated and combined to create new shapes with new attributes and features. Shapes are then used to introduce different fractional parts as well as compare parts and begin equal group stories using fractions and shapes. The incremental development of fractions provides students the time to understand and master the components of each shape both two-dimensional and three-dimensional shapes and fractional parts using various shapes.</td>
</tr>
<tr>
<td>Geometry</td>
